A total of **10 test cases** were executed for the testing of **practicesoftwaretesting.com**. The majority of test cases passed successfully, confirming that the core application functionality is generally stable. However, **several test cases failed**, resulting in the identification of multiple defects.

Key issues identified during testing include:

- A **functional defect** where the product quantity increase and decrease buttons did not respond as expected when attempting to add items to the cart

- A **compatibility defect** where images loaded correctly in Google Chrome but failed to display in Mozilla Firefox and Microsoft Edge

- A **negative/system handling defect** where an error code ("304") appeared as a selectable payment option during the checkout process

- A **UI defect** where broken images were displayed instead of the intended visual content

- A **navigation defect** where users were redirected to an incorrect page

Overall, the application's core features functioned as intended in most scenarios; however, improvements are required in **error handling, cross-browser compatibility, navigation accuracy, and UI reliability** to enhance the overall user experience and system robustness.
